

Mussel rope

We produce specially designed mussel collector ropes, also known as spat collectors. These ropes provide an artificial substrate in the sea where mussel larvae can naturally settle and attach.

Our mussel rope has been developed for effective spat settlement, high breaking load, abrasion resistance and ease of handling. It is free from heavy metals and other harmful substances.

Our mussel collector ropes are made from durable polyester fibers, with a structure that provides numerous suitable attachment points. The collector itself is constructed as a sleeve filled with small glass marbles. This provides the rope with both weight and the right structure, while keeping the fibers open to create optimal conditions for mussel larvae to settle and attach. Mussels are farmed without feeding, as they filter nutrients directly from the water.

The result is a simple, efficient and sustainable way to establish mussel production, based on the natural processes of the marine environment.
